

## The recent boom in medical transcription services

Today medical transcription has evolved into a full grown industry in its own right. Several countries such as India provide offshore medical transcription services of very high quality at affordable rates.

### Why is it necessary?

In the medical industry all doctors require that the doctor patient conversations be recorded and filed for future references. This is required for documentation needs as well as for placing into the patient's file. Therefore, there has been a large scale surge in demand for medical transcription services in order to translate the oral reports of doctors in various fields to place them into digitized documents.

### Major outsourcing initiative

Medical transcription has begun to be outsourced in a large way. This is because the timelines are often stringent and budgets are often scarce. This is why outsourcing medical transcription services is a good idea for many organizations related to the medical field. Instead of a partial devotion to the job which would have been done by a secretary, an outsourcing firm will dedicate its complete attention and time. Hence the timeframe within which the job gets accomplished is much faster. Besides, most of the medical transcription providers have obtained a qualified degree and hands-on training in the job. Therefore, these personnel are in a much better position to do the job.

### How is it done?

Typically medical transcription services are performed by trained specialists. Basically, the doctor or medical company will send the audio file to the medical transcription company. This file then needs to be typed out while ensuring 100% accuracy. Every word needs to be exactly as per the audio file as this digitized document will serve future reference purposes for doctors. While it is mostly the Asian companies who are the target for such services, today even companies in US have started providing these services to doctors.
