

Block websites on your computer

Broadband Internet connectivity is so common these days that almost no one has a second thought about connecting to the Internet. Connecting is easy, but what if you need to control or restrict the ways in which the Internet connection is to be used? Sure enough, widespread availability of unlimited, unmetered Internet connections has its pros. But what about the cons?

Everybody is talking about nowadays how fast their connection is. Fast and unlimited maybe fine for the most home users, but this is not necessarily the same for work or study environments, public places, or specific age groups. The Internet contains enough threats such as spyware and viruses to make you wish to restrict access to certain resources. A virus can corrupt or destroy information on your PC, causing you spending days to recover data. Spyware steals your personal information and slows down your computer's performance, making it a pain to work on. While it is usually possible to fix a PC contaminated with spyware and viruses, it is much safer and easier to prevent the infection in the first place – by restricting the browsing to the list of known, safe Web sites.

Restrict Internet browsing in Internet Explorer to the defined list of safe Web sites with Ashkon Software WebAllow <http://www.weballow.com!> WebAllow prevents electronic infections by block access to all but selected preapproved Web sites in Internet Explorer, effectively protecting your computer from spyware and viruses. If a user on your computer tries to access a website that is not on the list of allowed sites, she is redirected to a Web page of your choice to inform her about your access restriction policy.

While viruses and spyware sound familiar enough, Internet threats are not limited to those. The Internet offers a great variety of resources that are not always appropriate for your audience. Online computer games may be fine for the kids, but they can occupy the employees' attention in an office. Online chats, forums and blogs are popular among students and office employees, occupying their time and taking away from their study or work – wasting valuable time. Finally, while certain Web sites may be appropriate for adults, these same sites are not likely to make you smile when accessed by your children due to coarse language or adult content.

Use WebAllow at home to block all but kid-safe Web sites on your home PC. Use it in the office to prevent your employees wasting their time playing computer games, chatting on the forums or reading breakdown news. Use the same product in the school, college or university to concentrate students' attention on their study by only allowing access to their online class materials. Install WebAllow in a store or in a library and allow your customers to access your book or product catalog and nothing else. Do not let your computer users misuse Internet connection with WebAllow!

When installed, WebAllow is easy to configure by the administrator, and impossible to disable or uninstall by the regular users. It embeds into Internet Explorer and makes it impossible to visit Web sites other than defined. WebAllow is light on memory and disk space, and is perfect to be used on any computer type from powerful workstations to public computers with small memory and hard drives.

Once configured, WebAllow requires absolutely zero administration and runs completely unattended. WebAllow will improve your personal privacy and computer security, protect your kids, increase employee performance and motivate students.
