

## How Provigro works

The erectile dysfunction treatment industry is a multi-billion dollar industry. There is no denying that Viagra has pioneered the erectile dysfunction treatment industry, but Viagra is not the only drug that can effectively treat erectile dysfunction. Drugs like Cialis and Levitra have already established themselves as a viable and a more effective means of treating erectile dysfunction. With so many drugs claiming to treat erectile dysfunction, one can get quite confused when it comes to choosing a drug to treat erectile dysfunction. Apart from Viagra, Cialis and Levitra, drugs like Provigro are also establishing themselves as viable and cost effective alternatives.

Provigro has become increasingly popular for a number of reasons, and compared to traditional erectile dysfunction medicines has numerous advantages. Provigro is an over the counter all natural drug composed of 11 herbs, and unlike Viagra does not require a doctor's prescription. Since, Provigro is pharmaceutically 'mild' in nature and has very little or no side effects at all, people all over the US are ordering Provigro without the fear of side effects. Clinical trials have proven that Viagra and other erectile dysfunction treatments have their side effects; but Provigro has zero reported side effects till date.

### How Provigro works

Erectile dysfunction is primarily caused due to insufficient blood flow to the penis, Provigro increases blood flow to the penis and helps sustain an erection (some people have reported an erection of up to 4 hours after using Provigro!).

Apart from increasing blood flow to the penis, Provigro is also believed to be a potent aphrodisiac. Although people have been using Viagra as an aphrodisiac, the clinical effectiveness of Viagra as an aphrodisiac has not been established. On the other hand, users of Provigro have reported sexual stimulation and Provigro is capable of increasing the brain's receptiveness to sexual signals and allows the brain to better interpret sexual impulses resulting in an erection. Research has proved that drugs alone are not sufficient to achieve an erection and without proper stimulation a sustained erection is highly unlikely. Provigro helps improve the brain's receptivity to sexual impulses and thus helps achieve an erection.

Provigro is completely free from 'fillers' and other additives. Compared to other erectile dysfunction drugs, Provigro is a special formulation that is designed to promote hormone stabilization and is hypo allergic in nature. Provigro is similar to a class of medicines called PDE5 inhibitors that address erectile dysfunction; however unlike other PDE5 inhibitors, Provigro has no negative side effects whatsoever.

Drugs like Viagra are unsafe for people that are suffering from heart conditions or are under medication for heart conditions. Provigro has been formulated specifically for treating erectile dysfunction (where as Viagra was discovered by accident and was basically designed to be an anti-hypertensive). Although, there is considerable debate if all natural drugs like Provigro are as effective as they claim they are, the truth is that many natural drugs are spurious and people using genuine Provigro have reported positive results.

### Facts and figures

Unlike other all natural drugs, Provigro has undergone scientific clinical testing. Candidates were supplied the medication three times daily, over a period of three months. The control group, administered by the double-blind placebo Scientific Method, found no significant change over the three month period. Respondents outside the control group reported a success rate of approximately 66% and respondents with prior complications like diabetes, low blood pressure reported a slightly lower success rate. However, 99% of all respondents reported positive results after using Provigro and Provigro is 99% successful for both emotional and physiological erectile dysfunction. Clinical testing has also revealed that there were no side effects whatsoever and the only negative feedback received was from people that were against using drugs to treat erectile dysfunction.
