

Car waxing

Auto Detailing

Auto detailing contains several elements done in layers to provide a beautiful shine and condition to any type of vehicle. It could be boat detailing, boat detailing, RV detailing, professional detailing and car waxing. Always make sure the auto detailing specialist chosen is a reputable one. The damage that can be caused by the use of improper products and technique can really cost a large amount to correct. In some cases, it might cost a whole paint job. Talk to some of the auto detailing specialist customers and you will find out that the detailing process helps to remove the contaminants floating in the air that can take the beauty out of a wonderful paint job. It will also help to reduce the amount of scratches and marks that show up. The cars surface will have a positively sparkling appearance to it. It also is a great way to protect the body against rust and oxides.

The first step in the process of auto detailing is to make sure the vehicle is clean and free from any type of dirt and grime. This necessary step will give direct access to the important clear coat finish that is the particular surface to focus on. The cleaning is not done with a regular car shampoo but instead, a clay bar is used. The special clay will take off any grime and air pollutants that can grab hold of the car. This clay will also take the most stubborn stains out of the hubcaps and rims caused by the brakes that other products cannot touch. It is safe for many types of surfaces including aluminum rims and older paint vehicles.

Once the dirt is removed by auto detailing, the polishing of the surface begins. The imperfect marks in the paint are delicately removed. This imperfect mark might be a scratch, a swirl, or small ding. The polishing goes beyond the clear coat to remove the deeper contaminant in the paint. The abrasion level of the polish is what categorizes it. The polish does what sandpaper does. The polish can start with a pre-wax polishing agent and end with a non abrasive glaze for shine. It takes out surface oxidation and very tiny scratches. Water spots are also taken out of the paint.

When the polishing is completed, auto detailing specialist will wax the surface of the car. The wax is a protective covering to protect from the contaminants just removed. It is better that the dirt and grime connect to the wax and not on the clear coat of paint. The forms of wax are liquids, creams, and pastes. The general ingredient in these waxes is a compound known as Carnuba. This wax is a fatty acid. It puts a hard layer between the paint and the environment. It will also provide a shine. Synthetic wax products can be used by the auto detailer to protect the cars delicate finish from the sun and fading. Synthetic waxes are a mixture of low solvent cleaners and UV stopping agents. The auto detailing specialist will be able to give you more information on the process and how it goes.
