

Traffic Cones – Showing Us The Way

Almost all of us, the regular 9 to 6 office goers, have confronted with the experience of getting jammed in a traffic snarl.

Courtesy:

1. An unfortunate accidents that woke the world around a certain amount of time ago, or
2. A roadside work on progress under the able instructions of the authority in civil construction of a municipality.

Let the cause be anything. A traffic jam is always a disgusting, abominable, damn... jam! Nothing equals in wasting precious time of ours. In most of the times, some impatient souls amongst us take to it with 'sleeves up' and proceed over with (voluntary or involuntary) sneering jeers at the whistling traffic inspectors (poor they!).

For all of us it's a cauldron where each day we make our way in and out - knowingly or unknowingly. The only respite remains to be the sight of those conical bits of traffic cones. Lined in certain innovative pattern to guide the snarl from farther augmentation, like guiding angels, they help us to reach to the safe end of the asphyxia congestion.

Why not expense some words on these Traffic cones. Helping us to avoid a dose of crash and dent everyday by positively influencing numerous cases of disciplined driving sessions; they are no less than wonders of the modern science. At least for those who identify science on the terms of comfort, traffic cones are sure winners in banishing any chance of further ruin of time.

"Conically graduating up just like a sorcerer's hat,
With flat bottom on the base of that
they come in bright and prominent fluorescent stripes -
visible on days and nights,
...all to make our life safe on each road strides ..."

Prominently present all around the globe, they are global personification of road safety and orderly traffic flow. If road safety departments world over hail them because of the portability, for motorists and pedestrians, they are simple, uncomplicated structures that remain from blocking too much of important road space.

Thanks to rigorous R &Ds by companies dedicated towards enhancing road safety. These simple, portable, yet effective and stable, traffic cones now come in a flexible, folding design with twin retro reflective collar, innovative LED on the top fitted with a static and flashing function, and all enhanced base strength.

So the good news is that the traffic cones are going to be more effective, visible and stable. God's goodness! Till there are no signs of improvement in traffic condition, these added specialties in traffic cones can offer us some more reprieve from lurking dangers of road clashes.

Till all the measures in decongesting road chaos are met, there is not a slight glint of doubt that traffic cones would continue to rule.

And we, with another tinge of jeering session of course, would happily follow these conical hats with bright orange stripes on. With compulsion in most of the times ...of course!
