

## WANT A PIER OR DOCK? NO PROBLEM!

Want to build a dock or a pier for your boat behind your lakeside home? Well, here's an idea — how about you do it yourself? That can't be a serious suggestion, can it? Thanks to Wickcraft's innovation in the decking and framing of piers, a single person can put together their own pier by themselves in just a short time. That's how easy the new assembly of these items is from Wickcraft. All of the parts snap together, so that you shouldn't have a problem (and you shouldn't be scared) when putting these pieces together.

How does it work? In Wickcraft's case, the piers have been designed to work together which makes for easy assembly. Traditionally, piers rely on pilings that have to be put deep into the bottom of a lake and are part of a complicated system of supports and engineering. Decking adds to the complex and specialized aspect of the set up. With help from Wickcraft, those complex pier construction days have been replaced with something better and easier.

With Wickcraft's setup, you get a [custom pier system](#) that stands up to the elements, but is light enough that it can be put together easily. The new [pier system](#) comes pre-made with a deck, frame and walkway which take a lot less time and knowledge to assemble. You can have a place to pull in your boat thanks to the easy, step-by-step process Wickcraft has come up with.

The way the Wickcraft works is reassuringly easy. Wickcraft has created the posi-lock system. With that, one piece of the dock attaches to another and then locks itself into the frame. After you have the frame set up, you screw in the decking, thanks to pre-drilled holes. With the ease of the system, you are also able to take the dock apart. That will enable you store the dock when it's not in use, protecting it from the winter and adding to its life.

The new system takes outside workers out of the picture, enabling you to put a pier together on your own with a few tools and your own construction ideas. The length of the dock is your decision as well as where it goes — over ground and water. This will determine whether or not you need posts and plates to support it in the water.

If you have to deal with putting the pier on the muddy bottom of a lake, you will need to call in the help of a professional. But, thanks to how efficiently the rest of the dock has been put together, you will find the labor and the cost of this additional step won't be prohibitive.

In the end, if you are looking for a dock, the posi-lock Wickcraft system gives you a cost-effective way to quickly assemble one, sometimes in less than a day. With the system, there's not much time separating you from starting the project and pulling your boat into dock.

### About the Author

Author Bio:-Wickcraft has served lake front owners since 1954 by manufacturing the finest, most durable [boat docks](#), [deck walkways](#), and [pier systems](#). Their piers, marine rails and walkway systems are made with pride by experienced and knowledgeable staff. Customer satisfaction is Wickcraft's first priority.
